

# Product Backlog Refinement

Product backlog refinement is an activity in Scrum where detail, estimate and order are added to product backlog items

Scrum team collaborate

Items should be "done" with a sprint

## SPLIT / SLICE

## Refinement involves

- Removing PBIs that no longer appear relevant
- Creating new PBIs in response to newly discovered needs
- Re-assessing the relative priority of PBIs
- Assigning estimates to PBIs which have yet to receive one
- Correcting estimates in light of newly discovered information
- Splitting PBIs which are high priority but too coarse grained to fit in an upcoming iteration
- Adding acceptance criteria

## Strategies for success

- ✓ It's not an event, so it doesn't have to be a meeting
- ✓ Salami slice items ready for the next sprint
- ✓ Work in subgroups of relevant contributors
- ✓ Divide and conquer
- ✓ It's a collaboration between the Scrum team
